St. Lawrence River Watershed
Recommendations & Implementation Strategy

Prepared for Franklin County Soil & Water Conservation District

This plan was prepared with funding provided by the New York State Department of State under Title 11 of the Environmental Protection Fund.

1 Introduction

This chapter of the Watershed Revitalization Plan sets forth recommendations designed to protect and restore the lands and waters draining to the St. Lawrence River in northern New York. These recommended actions focus on measures to enhance water quality and the natural environment while protecting quality of life for residents and aligning with the community’s vision for a sustainable future. Achieving the community’s vision will require balancing multiple factors; these factors include economic development, water quality and habitat protection, recreation, food security, and building resilience to a changing climate. Implementing the recommendations will require a coordinated effort across multiple levels, including federal, state, and local governments, educational institutions, resource management agencies, not-for-profit organizations, and community residents.

The recommendations reflect a watershed-specific analysis of the natural and built environment, current water quality conditions, key sources of pollution, and the existing institutional framework. Some recommendations address improving land conditions and water resources while others are oriented toward long-term protection.

Recommendations are grouped into eight broad categories:

- Agricultural Practices and Management
- Floodplain and Stormwater Management
- Forest Management
- Invasive Species Management
- Infrastructure and Development
- Water and Wastewater Management
- Water Quality Research & Monitoring
- Watershed Planning, Management, & Outreach

Each recommendation includes discussion of the need for action, benefit, and potential leadership. Some of the recommended actions apply broadly across the entire watershed. As outlined in Section 2, general recommendations are grouped into three categories: restoration and protection actions; collaboration, partnership, and outreach; and municipal and programmatic actions.

However, the large and diverse watershed area also requires tailored recommendations to reflect regional differences. Each HUC10 subwatershed within the St. Lawrence River watershed has its own set of factors that influence water quality and offer unique opportunities for protection and restoration. Priority focus areas for each subwatershed are identified in Section 3.
Finally, Appendix X presents a summary matrix of specific measures for watershed revitalization connects recommendations to strategy components to be advanced and watershed goals to be achieved.
2 Role of Municipalities in Watershed Protection

The purpose of this plan is to identify needs and water quality issues for the St. Lawrence River watershed. However, the 5,600 square-mile watershed encompasses all or portions of eight counties and 100 municipalities in northern NY, each with its own unique water quality needs and priorities.

As the New York State Constitution provides for home rule, the primary authority for guiding community planning and development is vested in cities, towns, and villages. This empowers local municipalities to define their community’s vision and manage important elements of its growth and development. Local planning and zoning laws are valuable tools to address the opportunities and challenges of development in the context of water resources management.

Municipalities within the St. Lawrence River watershed differ widely in the extent to which effective planning and zoning tools have been adopted. While some municipalities have a comprehensive set of land use regulations and guidelines, other communities have zoning but lack other planning tools. The lack of a comprehensive plan for some municipalities inhibits the decision-making with regards to new development and other activities that can influence the community’s character. This is important in watershed planning because land uses can have a direct impact on water quality within the watershed. Understanding land use regulations and tools is important as considerations are given to how land use changes and development has the potential to influence water quality within the watershed. Table 1 provides a brief overview of the presence or absence of several relevant county-level land use planning tools within the St. Lawrence River watershed.

Source: New York Land Use Tools: A 2008 Survey of Land Use Planning & Regulations in NYS (NYS Legislative Commission on Rural Resources)

Municipalities should review the current inventory and municipal assessment from the "St. Lawrence River Watershed Institutional Framework and Local Laws Assessment" with representatives from each municipality to identify gaps and areas for improvement. Where gaps exist, municipalities should
incorporate applicable recommendations in their land use control program. Specific topics to address water quality concerns may include:

- Compliance with SPDES Stormwater Construction Permit requirements
- Lakeshore/riparian overlay districts
- Floodplain protection
- Sediment and erosion control
- Limitations on impervious cover
- Steep slope development restrictions
- Riparian setbacks

Although there are significant differences among watershed municipalities in regard to land use, population, and current local laws, municipalities should work together to improve consistency throughout the watershed to address water quality. Efforts should be made to adopt NYSDOS Model Local Laws to Increase Resilience, particularly in watersheds vulnerable to flooding.

Recommendations concerning municipal actions have been folded into the general watershed recommendations under municipal and programmatic actions for each category. All of these actions are intended to be acted upon; however, it is important to recognize the disparity amongst county and municipal resources. For example, Franklin County lacks a Planning Department, which reduces resources and staffing capacity to implement this Plan. An approach to addressing this gap in capacity could be to add regional planning professionals to act as “circuit riders” to enhance local efforts to ensure that water resources issues are addressed. Therefore, it is highly recommended that municipal officials and budget committees are educated on the purpose and need for this Watershed Revitalization Plan and that efforts be made to build capacity in terms of staffing and resources to ensure effective implementation of this Plan.
3 General Recommendations for Watershed Health

3.1 Introduction

General recommendations are appropriate across the watershed to advance the community’s vision for the future. The actions are grouped into three broad categories: (1) restoration and protection actions to minimize adverse impacts of human activities on lands and waters; (2) collaborations, partnerships and outreach to maximize effectiveness of actions and build local support; and (3) opportunities for local officials to strengthen communities and environmental protections.

**Restoration and protection actions** are designed to minimize nonpoint source pollution and protect and restore the quality and ecological functioning of water resources; these actions are often referred to as “best management practices” or BMPs. A management practice is considered “best” in context of a specific land use and environmental setting. What works in one area may not be feasible or cost-effective in another due to site-specific factors. BMPs can have a broad, generic application or can be highly specific to certain geographic, hydrologic, and chemical conditions. BMPs are often most effective when combined with other practices in a system that reduces sources, minimizes edge-of-field losses, and prevents transport to receiving waters.

Recommendations also center around opportunities for **collaboration, partnerships, and outreach** to advance the recommendations of the St. Lawrence River Watershed Revitalization Plan. The SLRWP coalition brought together multiple levels of government, resource management agencies, and volunteer organizations to develop the Revitalization Plan. Continued collaboration among these partners will be essential. Outreach to watershed communities on resource management issues will be needed to build local support for actions such as modifications to local laws, enhanced investment in staffing resource management agencies, and participation in citizen monitoring programs.

The third category of recommendation encompasses **municipal and programmatic actions** for watershed municipalities. As the New York State Constitution provides for home rule, the primary authority for guiding community planning and development is vested in cities, towns, and villages. This provides local municipalities with the power to direct a community’s vision and growth. Local planning and zoning laws are valuable tools to confront both opportunities and challenges of development and watershed planning. Strong local leadership is essential to promoting sustainability, reducing the risk of flood damage, and revitalizing communities through the adoption of appropriate zoning and land use policies. The *St. Lawrence River Watershed Revitalization Plan: Local Laws and Programs Affecting Water Quality* is a comprehensive overview of relevant planning tools and their use across the watershed. This document is appended to the 2020 Watershed Characterization Report.
3.2 Agricultural Practices and Management

Agriculture is a leading industry and land use in the St. Lawrence River watershed, particularly along the St. Lawrence River floodplain where rich soils and relatively flat elevation provide excellent conditions for farming. Not only does agriculture play a significant role in the economy, the agricultural landscape reinforces the rural character of the north country, retains valued open space and scenic vistas, and supports wildlife habitat. An estimated 620,700 acres (approximately 17%) of the lands within the St. Lawrence River watershed were dedicated to agriculture in 2017 (USDA Census of Agriculture, 2017).

New York strives to balance the essential services of agricultural production with environmental protection. Larger livestock farms are classified as Concentrated Animal Feeding Operations (CAFOs) and regulated through State Pollutant Discharge Elimination System (SPDES) permits. CAFOs are required to complete nutrient management plans, emergency response plans, and other information related to resource management. For smaller farms below the CAFO thresholds (AFOs), the focus is on voluntary incentive-based adoption of BMPs. The tiered Agricultural Environmental Management (AEM) program is a voluntary program managed by county Soil and Water Conservation Districts. AEM provides customized technical advice and support to producers tailored to their individual circumstances. The tiered approach begins with inventory and planning and progresses through implementation and assessment. An adaptive management approach ensures that the technical advice and support is responsive to changing circumstances and new information.

Despite these efforts, agricultural land use practices are a significant contributor to nutrient and sediment inputs to waterbodies in the St. Lawrence River drainage; agriculture adversely affects 26% of assessed stream miles and 15% of assessed lake acres. The NYSDEC 2016 Waterbody Inventory/Priority Waterbodies List for the watershed cites the following agricultural conditions and practices for their adverse impact on water quality and aquatic habitat:

- Increased siltation/sedimentation and nutrient inputs from agricultural runoff
- High rates of erosion from row crop production, most commonly corn grown for silage
- Crop production on steep slopes and erosive soils adjacent to the river
- Improper manure storage and handling, e.g., daily manure spreading, stockpiling of manure along streambanks throughout winter and loss to the stream during spring runoff, winter manure spreading on frozen ground
- Large numbers of cattle with access to streams resulting in streambank erosion and pathogen inputs

Recommended practices to mitigate these impacts and control nonpoint source pollution from agricultural lands are tabulated in section 3.2.1.
3.2.1 Restoration & Protection Actions

1. Increase Implementation of Best Management Practices (BMPs)

   **Description**  Erosion control practices include both operational and vegetative practices designed to retain, divert, or collect runoff. Examples include but are not limited to:
   - Conservation tillage (no till, strip-till, reduced-till)
   - Contour farming
   - Cover crops
   - Manure injection fertilization
   - Strip-cropping
   - Vegetative covers
     » Buffer strips
     » Riparian buffers
     » Vegetative treatment areas
   - Waterways/water drainage systems

   **Benefit**  These practices reduce pollutant transport in surface runoff by decreasing soil erosion and surface runoff volumes by increasing the soil’s infiltration capacity. Plant residue on the soil surface reduces soil and nutrient loss during storm events and decreases runoff volumes by increasing the soil’s infiltration capacity. In addition, conservation tillage reduces compaction, saves time, fuel and labor costs, increases soil organic matter and moisture-holding capacity, and lowers soil loss due to wind erosion.

   **Partners**  SWCDs, NYS Ag & Markets, USDA-NRCS, NYSDEC, Farmers

   **Resources**  [NYS Soil & Water Conservation Committee's Agricultural Best Management Practices System Catalogue](#)

2. Provide Adequate Manure Storage and Management

   **Description**  A manure management system includes a plan for the collection, transport, and storage of manure. The design is dependent on livestock operation, site location, and management considerations. A manure storage system controls the loss of nutrients and pathogens by safely storing manure when the potential for erosion and surface runoff is high.

   **Benefits**  Adequate manure storage systems reduce nutrient loss when runoff and erosion potential is high, allow manure to be treated as a resource rather than a waste, and improve herd health, aesthetics, and relations with neighbors. Without adequate storage facilities in the north country, farmers must resort to winter manure spreading on frozen ground.
3. **Promote Pasture Management**

**Description**
Prescribed grazing involves subdividing pastures and hayfields into 5 or more paddocks for a grazing season. The size and number of paddocks is dependent on the level of pasture productivity, livestock density, and residence time. The frequent rotation of livestock allows forage to recover from grazing, permitting vegetative productivity and re-growth.

**Benefits**
Overgrazing of pastures reduces ground cover and total forage yields. When a prescribed grazing management system is in place, forage is improved and ground cover is increased thereby preventing soil erosion, reducing surface runoff, and distributing animal manure. Infiltration is increased. Critical resources including riparian buffers, streambanks, and shorelines are at lower risk of damage.

**Partners**
SWCDs, NYS Ag & Markets, USDA-NRCS, NYSDEC, CCE, Farmers

4. **Develop and Implement AEM Tier III Management Plans**

**Description**
Nutrient management is an integrated approach to maximize economic production of soil, crops, animal feeds and products, and commercial fertilizer. Management incorporates soil testing, manure nutrient analysis, and timing, placement, and method of nutrient application. AEM Tier III Management Plans evaluate all aspects of farm production and prescribe conservation practices to advance production and natural resource conservation goals. Practices are selected based on site-specific conditions of soil, topography, drainage, cropping practices, and livestock density. Comprehensive Nutrient Management Plans (CNMPs) are the foundation for the NYSDEC regulatory program to control potential water pollution from Concentrated Animal Feeding Operations (CAFOs) under state General Permit GP-04-04. CNMPs are also required for farms seeking federal or state cost-sharing to construct manure storage structures. Any livestock farm seeking to maximize production while efficiently managing their natural resources and protecting the environment is also encouraged to develop and implement a CNMP.

**Benefits**
AEM Tier III Management Plans address elements such as manure and wastewater, feed, and nutrient management, record keeping, and emergency action planning. These plans help farmers achieve sustainability goals, protect water quality, and make them more competitive when applying for cost-sharing funds.
3.2.2 Collaboration, Partnerships, & Outreach

5. Increase Engagement with Agricultural Environmental Management (AEM)

Description
AEM is a cooperative interagency program led by SWCDs that provides one-on-one help to farmers to inventory existing environmental stewardship practices, address those that contribute to soil and nutrient loss, identify opportunities for mitigation, and enhance farm viability. By participating in AEM, farmers can document their environmental stewardship and advance their positive contributions to their communities, food systems, economy, and the environment. Farmers work with local AEM resource professionals to develop comprehensive farm plans using a tiered process:

- Tier 1 – Inventory current activities, future plans, and potential environmental conservation interests
- Tier 2 – Document current land stewardship while assessing and prioritizing potential environmental concerns
- Tier 3 – Develop farm plans to address concerns and opportunities identified in Tier 1 and 2
- Tier 4 – Implement plans utilizing available financial, educational, and technical assistance
- Tier 5 – Evaluate and update plans to ensure continued environmental conservation and farm viability

Contact your local Soil and Water Conservation District at www.nys-soilandwater.org/contacts or visit the AEM website at www.nys-soilandwater.org/aem to learn more.

Benefits
AEM is a resource for farmers to help identify effective BMPs for their operations to improve water quality. Farmers are more-eligible for cost-share projects, ability to prioritize and implement projects/practices that can reduce soil erosion and runoff. For qualifying operations, engagement in AEM may help promote farm products through New York State Grown & Certified.

Partners
SWCDs, NYS Ag and Markets, Farmers
6. Inventory Current Agricultural Practices and Improve GIS Data

**Description**  Inventory the location (HUC12 level, GIS data) and implementation of BMPs within the watershed. This would help to track existing practices and identify opportunities for improvement.

**Benefit**  A long-term database of implemented projects, together with water quality monitoring, would help determine the efficacy of a particular BMP. In addition, it would provide data to determine which practices are most appropriate or popular for a region.

**Partners**  SWCDs, NYS Ag & Markets, USDA-NRCS, NYSDEC, Farmers

7. Build Rapport Between Agricultural Community and the Public

**Description**  Coordinate and improve communications between the agricultural community, municipalities, and other watershed stakeholders in topics such as:

- Right to farm laws
- The need for public and private funds to help advance installation of BMPs within the watershed
- Water quality impacts of certain agricultural practices
- Steps farmers take to mitigate water quality impacts of agriculture

**Benefit**  Developing relationships between farmers, the public, and municipalities could potentially increase BMP implementation by removing barriers to adoption.

**Partners**  NYSDEC, SWCDs, County Planning, CCE, farmers

3.2.3 Municipal & Programmatic Actions

8. Seek Additional Support for Agricultural Services

**Description**  Seek additional sources of support for agricultural programs and services provided by SWCDs and Cornell Cooperative Extension (CCE). Encourage enrollment in Agriculture Districts.

**Benefits**  Funding support is critical to fulfilling goals for the watershed, implementation efforts would result in reduced nutrient and sediment loss.

**Partners**  NYSDEC, SWCDs, County Planning, CCE, farmers

**Description**  Qualified, certified planners are needed to develop Comprehensive Nutrient Management Plans (CNMPs), which evaluate all aspects of farm production and offer conservation practices that help achieve production and natural resource conservation goals for farm businesses. CNMPs are the foundation of the NYSDEC regulatory program to control potential water pollution from CAFOs under state General Permit GP-04-04. Use of CNPs is a requirement for farms seeking federal or state cost-sharing for manure storage structures.

**Benefits**  Having in-house certified planners at SWCDs would expand the agencies’ capacity to serve the agricultural community and increase the funding stream for developing AEM Tier III Plans.

**Partners**  NYS Ag & Markets, SWCDs, Municipalities

3.3 Floodplain and Stormwater Management
The St. Lawrence River watershed is experiencing increased frequency and intensity of flooding events, particularly along the St. Lawrence River shoreline. Localized flooding can result from minor to heavy storms, prolonged precipitation events, or river flow management decisions. Runoff can overload drainageways, send flows into streets and low-lying areas, back up sewers, cause areas to be inundated, wreak havoc on municipal water systems, cause safety hazards, be detrimental to affected residents and business owners, damage habitat, erode streambanks, and allow for transport of sediment, nutrients, oils and other chemicals.

To adapt to this new normal, watershed communities need to build resiliency through proactive management of development, infrastructure, and stormwater. Examples of strategies for floodplain and stormwater management include:

- Use planning tools such as overlay districts to restrict development in flood-prone areas such as floodplains and wetlands
- Use planning tools and other incentives to direct new development to areas less vulnerable to flooding
- Actively manage stormwater to maximize storage, slow velocity, and encourage infiltration.

Below is a list of best management practices, management strategies, and opportunities for growth to protect and enhance floodplain and stormwater management.

3.3.1 Restoration & Protection Actions

1. Complete Streambank Assessments and Restoration
Description: Conduct surveys and field inspections of streams within the basin to assess their stability and propensity to contribute to soil erosion and hydrological problems. Develop an inventory and assessment protocol to prioritize efforts of streambanks in need of restoration. Design and implement stream restoration to restore (or mimic) natural hydrologic and biological processes using soft or vegetative engineering.

Benefits: Assessment efforts will allow for the prioritization of restoration efforts and increased resilience to flooding and erosion after restoration.

Partners: SWCDs, NYSDEC, Trout Unlimited, Nonprofits

2. **Wetland Restoration, Rehabilitation, Enhancement and Creation**

Description: Wetlands can be physically, chemically, or biologically manipulated to enhance/restore their natural functions. Wetlands help reduce the frequency and intensity of floods by slowing velocity and promoting infiltration and evapotranspiration.

Benefits: Reduce frequency and intensity of flooding, filter nutrients, slow runoff, and reduce transport of sediment and nutrients.

Partners: NYSDEC, USEPA, USDA-NRCS, SWCD, TILT, IRLC

3. **Implement Stormwater Best Management Practices and Green Infrastructure**

Description: Effective stormwater management involves implementation of structural, vegetative, and institutional best management practices. Examples include bioretention ponds, bioswales, permeable pavement, filter strips, spill prevention, and waste reduction practices.

Benefits: Flood control, pollution prevention, and recreation and environmental amenities.

Partners: NYSDEC, SWCDs, Municipalities

3.3.2 **Collaboration, Partnerships, & Outreach**

4. **Commence an Educational Program on Stormwater and Floodplain Protection**

Description: Initiate an educational program and instruction for local land use planners, highway departments, and regulators, with the goal of increasing knowledge of the critical need for healthy sustainable wetlands and develop methods to incorporate this awareness into their decision making and planning processes.

Benefits: Strengthen local capacity for successful management and protection by empowering decision-makers.

Partners: County Planning, NYSDOS, NYSDEC, DANC, SWCD, SLRWP
5. **Implement a Formal Drainage Maintenance Program**

**Description**  
Inspection and maintenance program for ditches, culverts, and storm sewers. Inspections scheduled at least annually and following large rain events. This program could potentially engage the public where a local resident “adopts” a drainage area and reports its status after a large rain event.

**Benefits**  
Identify and repair areas that are damaged, blocked, or lack capacity to handle flow.

**Partners**  
County Planning, DANC, SWCD, County Highway Departments

6. **Complete Mapping of Flood-Prone Areas**

**Description**  
Flood maps across much of the St. Lawrence River watershed are incomplete, out of date, or not available in digital format. FEMA’s flood hazard mapping program identifies flood hazards, assesses flood risks and partners with states and communities to provide accurate flood hazard and risk data to guide them to mitigation actions.

**Benefits**  
Mapping of areas would allow smarter decisions to be made concerning development.

**Partners**  
FEMA, County Planning, DANC, SWCD, County Highway Departments

7. **Expand Participation in the NYSDEC Trees for Tribs Program**

**Description**  
Trees for Tribs is a statewide program that works to reforest New York State’s tributaries by planting trees and shrubs to create riparian buffers.

**Benefits**  
Riparian buffers help slow runoff, decrease erosion, reduce flood damage, improve habitat, and protect water quality.

**Partners**  
NYSDEC, SLRWP, County SWCDs, Municipalities, Land Trusts, Not-for-profit Agencies

3.3.3 **Municipal & Programmatic Actions**

8. **Reserve Open Space and Floodplain Property Through Property Acquisition**

**Description**  
Allow communities to purchase flood-prone properties and reserve them for floodplain protection and open-space.

**Benefits**  
Restoration of open space and natural land cover will reduce flood hazard and provide recreational amenities.

**Partners**  
Municipalities, FEMA, Land Trusts, The Nature Conservancy, TILT, IRLC

9. **Adopt Local Measures to Limit Activity on Floodplains**

**Description**  
Municipalities without adequate floodplain protections should modify comprehensive plans and zoning laws to limit development in floodplains.
Benefits  Reduced loss caused by floods and protection of floodplains
Partners  State, regional, and county planning agencies; APA, elected and appointed local officials

10. Incorporate Shorelines in the Definitions Section of Municipal Zoning Ordinances

Description  Definitions should include shorelines of lakes, streams, creeks, ponds, wetlands, and other waterbodies.
Benefits  A clear definition (indexed to an elevation or mean high water level) allows maximum efficacy of the local law or zoning ordinance question.
Partners  Municipalities, County Planning, NYSDOS

11. Adopt Watercourse Setback and Protection Regulations

Description  Extend buffer areas along streams, lakes, ponds, creeks, waterways, channels (e.g., 35 ft each side) and wetlands (e.g., 100 ft). These areas should prohibit placement of impervious surfaces and require natural vegetation. The recommended buffer width is 100 ft, with a 35 ft minimum.
Benefits  Forest and grass buffers help filter nutrients, sediments and other pollutants from runoff as well as remove nutrients from groundwater.
Partners  DANC, County Planning, Municipal Planning Boards, Agricultural Protection Boards

12. Revise Land Use Laws to Limit Development on Slopes

Description  Steep slopes (>10%) typically are more prone to erosion; consequently, communities should regulate development of these areas to reduce erosion, property damage, and risk of landslides. Options include adoption of a local law, designation of an overlay district, and enhanced requirements for erosion and sediment controls during construction.
Benefits  Reduced erosion and sedimentation.
Partners  County Planning, APA, DANC, municipal planning boards

13. Create and Adopt Stormwater Pollution Prevention Plans

Description  Secure funding for non-MS4 municipalities to create and adopt stormwater management plans. Stormwater programs traditionally regulate stormwater
discharges from three potential sources: municipal separate storm sewer systems (MS4s), construction activities, and industrial activities. Only 2 of the 100 watershed municipalities are MS4 communities. MS4 communities are required to develop Stormwater Pollution Prevention Plans (SPPP) that aim to prevent and reduce pollutant runoff through pollution prevention measures. These communities must implement a 6-point management program that includes public education and outreach, public participation and involvement, illicit discharge detection and elimination, construction site runoff, post-construction controls, and good housekeeping and pollution prevention. This includes the implementation of BMPs such as street sweeping, road salt reduction, and incorporation of adaptive landscape features called green infrastructure. Extending the requirement to non-MS4 communities to develop SPPP’s would further reduce runoff and contamination to waterbodies.

**Benefits**
Reduce runoff contamination and slow the transport of water.

**Partners**
NYSDEC, municipalities

**Resources**
- Green Infrastructure Modeling Toolkit (USEPA)
- Community Solutions for Stormwater Management (USEPA, 2016)

### 3.4 Forest Management

The St. Lawrence River watershed includes a considerable forestry base. Forests are environmental and economic assets that provide a range of ecosystem services: habitat, scenic vistas, recreation, wood products, carbon sequestration, and improved watershed health. Forest management is necessary to keep large tracts intact, protect habitat and migration corridors, provide resilience and value to an area. Forests are managed for a variety of purposes including commercial logging, habitat protection, recreation and aesthetics, and watershed protection.

When properly managed, tree harvesting has minimal impacts on the forest and can improve forest conditions by making way for new growth. However, unsustainable harvesting practices can weaken growing stock and contribute to erosion and sedimentation. Selective cutting of mature trees may leave a less diverse and lower-quality forest behind. Fragmentation of forests due to land use changes and development have degraded habitat, decreased biodiversity and recreational value, and jeopardized forest-related businesses. Logging roads are an additional source of sediment, particularly when abandoned without reseeding.

Much of the forested lands in the St. Lawrence River watershed are under the jurisdiction of the Adirondack Park Agency (APA) and NYSDEC and are therefore subject to their management guidelines. These lands consist of Forest Preserve, Forever Wild Areas, State Forests, and Wildlife
Management Areas. Creation of the Forest Preserve was largely motivated by a desire to protect water resources; Forest Preserve and Forever Wild Areas do not allow timber harvesting. State Forests and Wildlife Management Areas do allow managed timber harvesting. Forest operations affecting more than 25 acres require a permit from APA.

Outside of the APA boundary, local government has the potential to play a role in forestry management. Within the St. Lawrence River watershed, few municipalities have enacted forestry-related local laws. The SWCDs provide support to landowners to manage their forested areas to meet multiple objectives and protect water resources. Strategies for forest management focus on:

- Ensuring continued viability of forestry and timber production
- Protecting water quality by utilizing BMPs during timber production
- Minimizing forest fragmentation

The following recommendations help meet these objectives.

3.4.1 Restoration & Protection Actions

1. Utilize Erosion and Sediment Control Mechanisms

Description  BMPs should minimize impacts of logging roads and harvesting practices on streams, lakes, and wetlands. Methods include silt fencing, rolled erosion products, water bars to control runoff flow direction, proper placement of skid trails, bridges, and haul roads, incorporating buffers, selective cutting, and replanting.

Benefits  Reduce erosion and sedimentation

Partners  APA, SWCD, CCE, Timber harvesters

3.4.2 Collaboration, Partnerships, & Outreach

2. Promote Sustainable Forestry Practices and Management

Description  Discourage clearcutting and encourage selective harvesting, which removes certain trees and improves forest health, vigor, and future growth by making way for natural regeneration. It is recommended to not remove more than 10% of the total forest area during any one harvest to maintain adequate canopy cover.

Benefits  Responsible forest management and stewardship allows a forest to provide sustainable ecosystem services, whether managed for timber harvesting, recreation, or wildlife habitat.

Partners  NYSDEC (Forest Stewardship Program), SWCD, CCE (Forestry Extension Program, Master Forest Owner Program), APA
3.4.3 Municipal & Programmatic Actions

3. Adopt Appropriate Zoning

**Description**
Zoning ordinances that assure that the land can be managed for multiple forest uses, including harvesting, while potentially conflicting uses such as residential subdivisions are discouraged. Municipalities should also review existing regulations to identify any “forestry unfriendly” language that may create obstacles to generally accepted forest management.

**Benefits**
Prevent fragmentation and conversion of forest land to other uses.

**Partners**
APA, municipalities

4. Require Buffer Strips Along Sensitive Areas

**Description**
Buffer strips along streams, steep slopes, scenic byways, recreational trails, and where rare, threatened, or endangered species are present.

**Benefits**
Reduce erosion and sedimentation, preserve sensitive habitats and scenic beauty, improve water quality

**Partners**
APA, municipalities, SWCD

3.5 Invasive Species Management

The St. Lawrence River watershed is vulnerable to invasive species because of its high recreation usage and proximity to a major shipping corridor. Invasive species can affect forests, agricultural crops, and the recreational quality and food webs of aquatic resources. The risk of damage to public health, native ecosystems, food supply, and economics is very high. Disturbed landscapes and areas affected by nonpoint source pollution may be even more at risk.

Given these impacts, it is essential that residents are aware of the risks of invasive species and understand the immense value of prevention, early detection, and rapid response. While it is not possible to eliminate invasive species from reaching the lands and waters, aggressive actions can help reduce the risk of these species becoming established.

Numerous efforts in invasive species management have been carried out by the Adirondack Park Invasive Plant Program (APIPP), the St. Lawrence-Eastern Lake Ontario (SLELO) PRISM, NYSDEC, and local nonprofits. Collaborative efforts within the watershed should focus on the following strategies:

- Education on invasive species, their impact, best practices, and what to look for
- Monitoring, early detection, and rapid response to prevent establishment of new invasive species
- Development of a prioritization tool to focus invasive species management efforts
Given these goals, the following recommendations are suggested.

3.5.1 Restoration & Protection Actions

1. **Install Watershed Steward Programs and Informational Kiosks at Public Boat Launches**
   
   **Description** Volunteer stewards stationed at water access sites to inspect recreational watercraft and gear for invasive species, provide boat washes (clean-drain-dry) and educate the public. High-use lakes within the Adirondack Park are already included in the Adirondack Watershed Institute’s Stewardship Program; therefore, new programs should focus on high-use waterbodies outside of the Park. Watershed steward programs will require ongoing support, including adequate funding to attract students to serve in remote areas. Informational kiosks educate the public on what invasive species are, their impact, and which ones to look out for.

   **Benefits** Reduced risk of invasive species introduction and establishment

   **Partners** PRISMs, citizens, NYSDEC, CCE Invasive Species Program, Adirondack Watershed Institute, Save the River, Indian River Land Trust, Indian River Lakes Conservancy

2. **Provide Signage at Marinas and Water Access Points**

   **Description** Development of standard signage with information at marinas and boat launches that inform the public with descriptions of local invasive species, watch species, proper decontamination methods and reporting contact information.

   **Benefits** Informs and allows the community with knowledge to reduce the spread of invasive species.

   **Partners** PRISMs, citizens, NYSDEC, CCE Invasive Species Program

3.5.2 Collaboration, Partnerships, & Outreach

3. **Advance the Capabilities of iMapInvasives**

   **Description** New York has adopted a management framework that includes both centralized and regional organizations and partnerships. These sites provide extensive information; however, the scattered array of online resources has a high potential for conflicting or outdated information and risks duplication of effort. The current iMapInvasives mapping resource provides outstanding opportunities for geographic analysis of invasive species challenges and empowering citizen science, however, its current platform limits usage. This site should be established by concentrating on fulfilling the needs of end-users, with an information architecture and design that make key information readily accessible. iMapInvasives staff should engage with Soil and
Water Conservation Districts (SWCDs), NYSDEC, Cornell Cooperative Extension, NYSDAM, etc., to evaluate opportunities for data sharing and ongoing software updates that facilitate shared goals.

**Benefits**
Encourages collaborative efforts, informs the public

**Partners**
iMapInvasives, APIPP, SLELO, NYSDEC, CCE, SWCDs, NYSIPM Program, NYS OPRHP, NYNHP, SUNY ESF

**References**

### 3.5.3 Municipal & Programmatic Actions

#### 4. Support and Expand Education and Monitoring to Improve Early Detection and Rapid Response

**Description**
Recruit, train, and coordinate scientists and citizens to assist in monitoring program and provide associated coordination, training, data management, and quality control. Efforts should focus on educating all field crews, cooperators, resource managers, volunteers, and visitors on invasive species identification. Through these efforts, priorities will be established to allow greater focus on species that pose the most significant threat.

**Benefits**
Public engagement, early detection of species may prevent full invasion, ability to set priorities

**Partners**
PRISMs, citizens, NYSDEC, CCE Invasive Species Program, Adirondack Watershed Institute, Save the River, Indian River Lakes Conservancy

#### 5. Support Watershed Stewardship Programs throughout the Watershed

**Description**
Volunteer stewards stationed at water access sites to inspect recreational watercraft and gear for invasive species, provide boat washes (clean-drain-dry) and educate the public. High-use lakes within the Adirondack Park are covered relatively well by the Adirondack Watershed Institute's Stewardship Program, however, the area would benefit from continued support, particularly with funding staff. Water access points outside the lake would benefit from expansion and adoption of a Watershed Stewardship Program at new sites.

**Benefits**
Reduce invasive species spread, prevention and education are most important for invasive species prevention

**Partners**
Paul Smith's College Watershed Stewardship Program, Adirondack Regional Watershed Stewardship Program, Lake Associations, NYS OPRHP, NYSDEC, SLELO, APIPP
6. Provide Support for Certified Pesticide Applicator Trainings and Equipment

**Description**  
Many invasive species management strategies include pesticide application.

**Benefits**  
Removes barriers to rapid response and early detection management strategies.

**Partners**  
NYSDEC, SWCDs, CCE

**References**  
NYS Invasive Species Comprehensive Management Plan (2019).

7. Support Post-IS Management Monitoring

**Description**  
Post-management documentation and evaluation is necessary to determine the effectiveness of management efforts. For example, number of native plants emerging, number of plants that don’t appear after 3 years are useful metrics.

**Benefits**  
Evaluate the effectiveness of invasive species management efforts, helps to determine the best and most effective projects to fund.

**Partners**  
NYSDEC, SWCDs, CCE

**References**  
NYS Invasive Species Comprehensive Management Plan (2019).

8. Support Research and Use of Emerging Technology to Monitor Invasive Species

**Description**  
Invest in research and technology tools to advance knowledge on invasive species interactions, mechanism of control and eradication.

**Benefits**  
Rapid and coordinated response to new detections

**Partners**  
iMapInvasives, APIPP, SLELO, NYSDEC, CCE, SWCDs, NYSIPM Program, NYS OPRHP, NYNHP

**References**  
NYS Invasive Species Comprehensive Management Plan (2019).

3.6 Infrastructure and Development

Municipal activities and development contribute to nonpoint source pollution. Construction, streambank erosion, changes in land use, and impervious surfaces have the potential to alter hydrological processes and contribute to sediment, nutrient and salt pollution.

Roadways and roadway ditches are designed to move water off the road as quickly as possible. As a result, road installation and maintenance activities can affect local hydrology and increase the risk that stormwater runoff will increase pollutant transport to waterways.
Deicing practices are a particular concern in the St. Lawrence River watershed. When considering the adverse effects, effectiveness, and economical reasons for sustaining our current winter road management strategies, hidden, chronic, and cumulative costs should be considered. Road salt has contaminated residential drinking wells and increased the salinity of adjacent waterbodies.

The recommendations below seek to minimize potentially adverse water quality impacts of municipal activity. Strategies include:

- reducing impacts of salt,
- minimizing erosion, especially during construction
- implementing stormwater BMPs, and
- preparing for a changing climate.

3.6.1 Restoration & Protection Actions

1. **Implement Road Deicing BMPs**
   
   **Description** Highway and road maintenance crews spread salt to de-ice roads, which ultimately moves into nearby road ditches and streams, leaches into groundwater, and may reach drinking water wells. A sampling of BMPs to minimize the impacts and maximize the effectiveness of road salt include:

   - Apply salt at lowest reasonable truck/applicator speeds (MDOT, 2012)
   - Utilize pre-wetting (brine added to salt prior to being road applied)
   - Apply anti-icing treatments (pretreatment of pavement with de-icing chemicals intended to prevent snow and ice from sticking to surface)
   - Calibrate spreaders and produce a calibration chart to be used as a guideline for operators to determine how many pounds per lane mile should be applied at any given spreader setting
   - Explore alternative deicers
   - Build salt/sand storage facilities

   **Benefits** Increased efficiency of road salt use, reduced salt contamination of adjacent waterbodies

   **Partners** NYSDOT, County Highway Departments, Local Public Works Departments

2. **Identify Areas Most at Risk of Adverse Impacts from Road Salt**
   
   **Description** Map sensitive areas using knowledge of landscape conditions, community structure, and known problem areas (e.g., increasing concentrations in soils, groundwater, streams, wetlands, and water supply wells). Areas identified as sensitive and
targeted for lower rates of deicing materials should have signage warning drivers of potentially icy conditions.

**Benefits**
Identifies vulnerable areas to road salt and develops a strategy to reduce impacts.

**Partners**
NYSDOT, NYSDEC, APA

3. **Invest in Improved Technology and Equipment**

**Description**
Standardized and automated systems including pavement temperature sensors, bucket scales, GPS/automated vehicle location systems, plow trucks with segmented plow blade, alternative blade technologies, closed loop ground speed controllers, and automated spreaders

**Benefits**
Advanced technology can improve winter road maintenance operations, saving municipalities money and reducing environmental impacts.

**Partners**
Municipalities, NYSDOT, County Highway Departments, Local Public Works Departments, Cornell Local Roads Program

4. **Implement Erosion Control Mechanisms**

**Description**
Methods for roadside erosion remediation include installation of sediment basins, hydoseeding of road ditches, ditch stabilization, rolled erosion products, bank toe stabilization, and check dam installation.

**Benefits**
Reduce roadside erosion and allow space for stormwater runoff infiltration and slow.

**Partners**
County Highway Departments, NYSDOT, SWCD, NYSDEC, Cornell Local Roads Program

5. **Streambank Assessment and Restoration**

**Description**
Design and implement streambank assessment and restoration programs that restore (or mimic) natural hydrologic and biological processes. Maximize the sue of bioengineering approaches and Design for projected impacts of climate change on rainfall frequency and intensity.

**Benefits**
Reduce erosion, improve habitat and water clarity, provide source water protection to water supply intakes.

**Partners**
SWCDs, NYSDEC, nonprofits

6. **Continue Surveying and Assessing Road-Stream Crossings**

**Description**
Assess culverts and bridges using the North Atlantic Aquatic Connectivity Collaborative (NAACC) protocol. This assessment identifies road-stream crossings that impede aquatic connectivity. Malfunctioning or inappropriately sized culverts can lead to flooding, erosion, sedimentation, and wash-out.
3.6.2 Collaboration, Partnerships, & Outreach

7. Expand Training Programs for Local and County Highway Departments

Description The training program should utilize classroom, shop, and on-the-road components to train operators on proper plowing, salting techniques, ditch and culvert design, streambank stabilization, hydroseeding, and erosion control.

Benefits Allows for a place to introduce new technologies and advances in road deicing, erosion control, and stabilization techniques to allow for proper and appropriate winter road maintenance.

Partners NYSDOT, County Highway Departments, Local Public Works Departments, Cornell Local Roads Program

3.6.3 Municipal & Programmatic Actions

8. Secure Funding for Regional Culvert Replacement Program

Description Secure continuous funding to address undersized, shallow, and culverts facing restricted flow that causes ponding and flooding or impedes habitat and connectivity. Replacing culverts with properly installed, sized, and placed culverts should allow for fish, wildlife, and floods to pass so that stream flows and velocities are unaltered.

Benefits Improved habitat, habitat connectivity, and drainage.

Partners Town and County DPW Budget Committees, NYSDOT, County Highway Departments, Local Public Works Departments, SWCD, USACE

9. Create a Road Salt Reduction Task Force

Description Create a task force with NYSDOT, local public works departments, County Highway Departments, and researchers to design and implement a pilot program to reduce the use of salt on state roads in the watershed; monitor and report.

Benefits Reduced impacts environmental, infrastructure, and automobile impacts to road salt contamination and exposure.

Partners NYSDOT, County Highway Departments, Municipalities, APA, Adirondack Watershed Institute, Cornell Local Roads Program
10. Assist municipalities with reviewing their local laws to reflect best practices to control nonpoint source pollution

Description
Review the St. Lawrence River Watershed Local Laws and Programs Affecting Water Quality with municipal representatives to identify gaps and areas for improvement. Specific topics to address water quality concerns may include:

- Compliance with SPDES Stormwater Construction Permit requirements
- Lakeshore/riparian overlay districts
- Sediment and erosion control
- Limitations on impervious cover
- Steep slope development restrictions
- Riparian setbacks

Despite the significant differences among watershed municipalities in land use, population, and local laws, a consistent approach to addressing nonpoint source pollution would benefit the watershed.

Benefits
Adoption of appropriate tools and ordinances to reduce risk of nonpoint source pollution from development activities.

Partners
Municipalities, County Planning, NYSDOS, Development Authority of the North Country, North Country Regional Economic Development Council

Resource

11. Support Community Participation in the Climate Smart Communities Program

Description
Climate Smart Communities (CSC) is a NY program that helps local governments inventory and reduce greenhouse gas emissions and adapt to a changing climate.

Benefits
Altering the built and natural environment will help alleviate the adverse impacts of climate change

Partners
Municipalities, NYSERDA, NYSDEC, NYSDOS

3.7 Water and Wastewater Management
Adequate water and wastewater infrastructure play an essential role in water quality. Drinking water and wastewater infrastructure are in constant need of maintenance, repair, and updating to protect the health of our streams, rivers, and lakes. Infrastructure must also be resilient to the impacts of climate change, including increased precipitation, sea level rise, stronger and more frequent storms, flooding, and periods of little precipitation.
Household water must undergo treatment to remove nutrients and pathogens prior to being released back into the environment to avoid negative impacts on receiving water quality. Municipal wastewater is either treated at a municipal treatment facility or is subject to on-site treatment (i.e., septic systems). On-site septic systems can provide adequate treatment and disinfection of wastewater when subject to regular inspection and maintenance. These systems are governed under Title 10 of NYS Codes, Rules, and Regulations, Public Health Law 201(1)(1). At present, onsite septics are managed at the municipal level within this watershed, with on-site inspections occurring if a problem occurs and/or is reported.

On-site septic systems are cited as a contributor of pathogens and nutrient loads to adjacent waterbodies, particularly around lakes that have experienced a transition from seasonal camps to full time residences.

Recommendations for improved wastewater management to reduce nutrient and pathogen inputs to receiving waters include the following strategies:

- address combined sewer overflows
- address on-site septic systems, and
- prepare infrastructure to meet climate change needs and flooding.

3.7.1 Restoration & Protection Actions

1. Address Combined Sewer Overflows (CSO)

Description Some sewage collection systems were designed to collect both municipal wastewater and stormwater and direct the flow to a wastewater treatment plant. In events of intense rainfall and runoff, the capacity of these collection systems is exceeded, and a mixture of stormwater and municipal wastewater is discharged to waterways through relief points called combined sewer overflows (CSOs). Measures should be taken to minimize discharge from CSOs through development and implementation of a facility's Long-term Control Plan.

Where Municipalities with CSOs (City of Ogdensburg, Villages of Massena, Clayton, Tupper Lake, Gouverneur, and Potsdam)

Benefits Reduce pollution to waterways and protect public health.

Partners City and Village WWTPs, NYSDEC, County Planning Departments

2. Improve Existing Municipal Wastewater Treatment Systems

Description Make necessary improvements to existing municipal wastewater treatment systems to ensure compliance with SPDES permits, accommodate populations served, and
remove nutrients. Encourage municipalities to secure adequate funding for infrastructure maintenance and asset management.

**Benefits**  
Compliance with SPDES permits, minimize nutrient and pathogen discharge.

**Partners**  
County Planning, Municipalities, Citizens, POTWs

### 3. Develop a Septic Monitoring Program

**Description**  
Work with County and local municipalities to develop funding options and an active program for identifying failing septic systems. The program should include incentives to induce residents and/or commercial establishments with substandard onsite septic systems to upgrade and/or consolidate to meet current standards of design and operation. The program could also aid homeowners in testing septic leaks making decisions regarding their septic systems.

**Benefits**  
Identify and address failing septic systems

**Partners**  
County Planning/SWCD/DOH, lake associations, NYSDEC, Municipalities, Development Authority of the North Country (DANC)

### 3.7.2 Collaboration, Partnerships, & Outreach

### 4. Educate Local Elected Officials

**Description**  
Develop and deliver to all local governments in the watershed, education and training to all planning boards and code enforcement officials to raise the level of understanding of the local authority and responsibility for onsite septic system monitoring.

**Benefits**  
Increase awareness of existing issues and develop strategies and funding to address wastewater management.

**Partners**  
NYSDEC, County Planning/SWCD/DOH, Municipalities, Development Authority of the North Country (DANC)

### 5. Educate Homeowners

**Description**  
Implement community based educational programs for homeowners and others on septic system maintenance and to reduce the introduction of contaminants to storm sewer systems (pet waste, lawn clippings and landscaping, solid waste management).

**Benefits**  
Increase awareness of existing issues and increase adoption of efforts to minimize pollution.

**Partners**  
NYSDEC, County Planning/SWCD/DOH, Municipalities, Lake associations

### 6. Initiate and Advertise Pharmaceutical Take-Back Programs
Description Programs to collect old, unused, unneeded, or expired medicines. These locations safely and securely gather and dispose of pharmaceuticals, including controlled substances. Drug Take Back Days, temporary drug collection sites should be set up in communities for safe disposal of prescription drugs.

Benefits Reduce the input of Contaminants of Emerging Concern into water systems

Partners NYSDOH, County Planning/SWCD/DOH, USDOJ Drug Enforcement Administration, local law enforcement

Resources US Food and Drug Administration: Where and How to Dispose of Unused Medicines

7. GIS Mapping of Sewered Areas

Description Develop a GIS map showing sewered and non-sewered areas, areas that are being contemplated to receive new sewer service through improvement or extension projects. Use this map to communicate updates of added connections and improvements to the sewer district.

Benefits Useful for watershed planning efforts and when considering extending public sewer systems.

Partners DANC, County Planning, NYSDEC

3.7.3 Municipal & Programmatic Actions

8. Adopt Uniform Sewer Ordinances/Sanitary Law

Description Currently, septic system regulation is dependent on township with most towns within the Adirondack Park adopting some septic system regulations for new development involving depth to groundwater table and bedrock, slope, waterbody setback, and percolation rate. Municipalities should update, or enact, sewer ordinances to protect water quality from private treatment systems (e.g., distance to waterbody, maintenance, provisions to allow alternative wastewater disposal methods). Residences within 500 ft of a lake and/or 150 ft from tributaries should be considered in a “critical environmental zone” and subject to more frequent inspection.

Benefits Reduce nutrient and pathogen input to groundwater and surface waters

Partners NYSDOH, SWCDs, Water Quality Coordinating Committees, County Health Department, County Planning, Municipalities, Lake associations

Resource NYSDOS, 2019. Model Local Laws to Increase Resilience

9. Consider Extending Public Sewers or Alternatives
Description There are areas within the St. Lawrence River watershed where individual on-site wastewater treatment systems are at a higher risk of failure. Where density allows, increase the number of residences served by the existing municipal systems. Encourage the use of alternative treatment systems such as cluster/community-based septic systems, especially in areas where lot sizes do not meet minimum on-site septic system requirements.

Benefits Extended sewer systems will reduce the risk to public health and the environment of inadequately treated wastewater reaching downgradient receiving waters.

Partners County Planning Departments, Municipalities, Citizens

10. Engage in Cost-Share Program for Failing Septics

Description Foster a cost-share program to repair or replace failing septic systems

Benefits Incentivize repairs by assisting homeowners with the cost.

Partners NYSDEC, County Planning/SWCD/DOH, Municipalities, Development Authority of the North Country (DANC)

3.8 Water Quality Research & Monitoring

There are numerous and diverse pollutants and sources affecting water quality in the St. Lawrence River watershed. Coordinated efforts are essential to successful monitoring and research programs. Therefore, recommendations for water quality research and monitoring include elements to leverage existing stakeholders, encourage citizen science, and foster collaboration to gain better understanding of the existing conditions and develop innovative techniques and technologies to restore the watershed. Key elements include:

- monitoring trends in water quality,
- encouraging participation in citizen science programs, and
- supporting research to inform future watershed management.

3.8.1 Restoration & Protection Actions

1. Monitor Legacy Contamination Remediation Efforts

Description Continue tracking the implementation plans for legacy contaminated sites (Superfund, Brownfield). Superfund sites fall under jurisdiction of an USEPA program intended to restore the nation's worst hazardous waste sites. Brownfield sites, which are typically former industrial areas where chemical pollutants have infiltrated the soil, fall under NYS jurisdiction. These sites are remediated to reduce the risk of contamination reaching environmental receptors.
3.8.2 Collaboration, Partnerships, & Outreach

2. Develop a Water Quality Data Repository and Collaborative

Description: Develop or engage with a centralized public water quality data repository.

Benefits: A central platform for water quality data will inform watershed projects, modeling, planning, implementation, and tracking efforts. Over time, the information will provide new insights into changing conditions across the watershed.

Partners: River Network, Izaak Walton League of America-Water Data Collaborative, SWCDs, NYSDEC, USGS, USDA-NRCS

3. Encourage Citizen Engagement and Citizen Science

Description: Citizen volunteers are invaluable resources for tracking water quality trends, sharing information, engaging others, and making projects happen. Citizen engagement in NYSDEC water quality programs such as CSLAP, PEERS, and WAVE allows residents and scientists to observe water quality status and trends. Continue and increase engagement in the Adirondacks Lake Assessment Program. Volunteers can target and map invasive species, assist in HAB monitoring, plant trees for riparian buffers, and much more.

Benefits: Engaging citizens in watershed monitoring will help reduce cost while also informing citizens of emerging issues that affect local water quality.

Partners: NYSDEC, Adirondack Watershed Institute, Lake Associations, citizens, students, high-school science programs, Indian River Lakes Conservancy, Save the River, APIPP, SLELO, Cornell Cooperative Extension, iMap Invasives, River Institute

3.8.3 Municipal & Programmatic Actions

4. Continue Funding for USGS Gauges

Description: Continue financial support for all stream gauges within the St. Lawrence River watershed.

Benefits: These gauges and resulting data are essential for tracking water levels and flow rates. Ultimately these data can support calculations of water residence time and pollutant loading rates that can provide a more quantitative backgrounds for planning.
Partners    USGS, Municipalities, NYS

5. Secure Funding for Drinking Water Testing Program

Description    Secure funding to establish and advertise a water testing program for residential wells, particularly in areas considered vulnerable to salt contamination from road applications or bacteriological contamination from wastewater or manure handling.

Benefits    Gives homeowners access to water testing to warn them of risks to health of people and livestock.

Partners    SWCDs, Adirondack Watershed Institute

3.9 Watershed Planning, Management, & Outreach

The success of this plan depends on an ongoing commitment of funding, planning and other resources to support protection and restoration initiatives. Therefore, recommendations for watershed management and outreach include elements of adaptive management to measure and track effectiveness of implementation efforts and adjust as needed. In addition, public awareness of the importance of water resources are necessary to build public support to fund implementation. Key strategies include:

- identifying needed collaborations and funding sources to implement recommendations,
- developing mechanisms to track and evaluate implementation efforts, and
- engaging stakeholders and the public to foster appreciation of watershed resources and support for the plan.

3.9.1 Restoration & Protection Actions

1. Designate and Support a Circuit Writer for the St. Lawrence River Watershed

Description    A circuit writer will work with municipalities to identify gaps in local land use tools and regulations that aid in protecting water quality and natural resources. The circuit writer will aid municipalities in adopting and writing needed measures to guide development and protect natural resources.

Benefits    Directs resources and capacity to priority areas or those in need of aid to implement the Plan.

Partners    SLRWP, DANC, NCREDC, Planning Departments, SWCD, NYSDEC, NYSDOS

2. Enforce Existing Regulations Impacting Water Quality and Protection

Description    Despite local laws to protect water quality and flood-prone areas, enforcement varies widely across the watershed. Improved training of Codes Enforcement Officers and Planning Boards is needed.
Benefits  Protect public health, environmental quality, and infrastructure.
Partners  Code Enforcement Officers, County Planning Departments

3. Develop an Implementation Reporting and Tracking System

Description  Establish an online, public inventory to record implemented BMPs, their status, and effectiveness with periodic reviews. A responsible party should be identified to review and update data annually.

Benefits  Result in the development of subsequent strategic plans to focus institutional energies and priorities to benefit the watershed as a whole.
Partners  County Planning, SWCDs, County DOH, NYSDEC, Municipalities

1. Use Media to Relay Information and Engage the Public on Plan Implementation Efforts

Description  Utilize the St. Lawrence River Watershed Project website, social media and other traditional news outlets to communicate progress and issues across the watershed.

Benefits  Public outreach builds community support for actions and investments to implement the recommended actions.
Partners  SLRWP, SWCD, NYSDEC, North Country Public Radio, North Country Now

2. Initiate a St. Lawrence River Watershed Annual Conference

Description  An annual conference with municipalities, researchers, lake and river organizations and other not-for-profits, NYS state agencies, agricultural support agencies, planners, federal partners such as USGS and IJC, and other interested parties. The goal would be to update progress toward recommended actions, promote water quality monitoring efforts, describe relevant research findings, and foster collaboration. Partnering with a University or College to host the annual conference should be considered; this model is used for the Mohawk River Plan which also encompasses a broad area and multiple resource management issues.

Benefits  Encourage data sharing, public outreach, and form collaborative partnerships within the watershed.
Partners  NYSDEC, County Planning/SWCD/DOH, Municipal departments, lake associations, NYSDOS, Adirondack Watershed Institute, Universities, Environmental Organizations, APIPP, SLELO, USGS, IJC

1. Develop Watershed Curriculum and Associated Teacher Training

Description  Support development of a watershed-based curriculum and teacher training that encompasses pollution prevention and watershed protection. Expand participation
of Cornell in the Classroom (CCE program) and encourage other types of classroom education on natural resources.

**Benefits** Expand opportunities for students to gain local knowledge of watershed-related issues, encourage STEM education, and improve scientific literacy.

**Partners** Cornell Cooperative Extension, Adirondack Watershed Institute, Indian River Lakes Conservancy, The Nature Conservancy

### 3.9.2 Municipal & Programmatic Actions

#### 2. Coordinate Funding and Other Resources to Implement Watershed Priorities

**Description** A subcommittee of the watershed collaborative should be established to tap existing resources and pursue new sources of funding to implement watershed priorities. Members should represent each geographic area of the watershed and have a range of affiliations to provide insight on priorities and knowledge of funding sources.

**Benefits** Additional funding sources would improve and speed up restoration efforts and could support implementation of best management practices.

**Partners** SLRWP, County Planning Departments, County DOH, SWCDs, NYSDEC, NYSDOS

#### 3. Establish an Ongoing Collaborative for Plan Implementation

**Description** Establish a central hub for collaboration on water resource issues throughout the watershed. Representatives from watershed municipalities and agencies responsible for land and water management should be active participants. The group should develop annual work plans and an organizational structure that allows for efficient implementation of the recommendations provided in this *St. Lawrence River Watershed Revitalization Plan*. A standard communication protocol for all organizations involved should be developed. The collaborative should provide an annual report to share information with the public regarding trends in resource management and ongoing progress with implementing the Plan’s recommendations.

**Benefits** A coordinated effort is necessary for the Plan to be implemented, tracked, and evaluated.

**Partners** SLRWP, County Planning/SWCD/DOH, NYSDEC, Municipalities

#### 4. Increase County Soil and Water Conservation Districts and Planning Departments Staffing to Implement Projects
| **Description** | SWCDs, Planning Departments, and associated technical staff are the boots-on-the-ground agency focusing on many issues related to resource management. SWCD staff communicate with farmers, collaborate on development and implementation of AEM programs and CNMPs, survey and restore streambanks and roadway drainage, obtain funding for water quality projects, and lead coordination efforts on many water quality-related issues. Planning Departments help communities plan and manage development and mitigate environmental impacts. |
| **Benefits** | Increased capacity to implement projects that reduce soil erosion and nutrient pollution. |
| **Partners** | Municipalities, SWCDs, County Planning Departments |
4 Subwatershed Priority Focus Areas

Although all of the general recommendations discussed above are intended to be implemented to improve conditions throughout the watershed, the reality is that implementation takes up many resources in terms of time, funding, staff, and support in order to be implemented. This section provides specific focus areas to implement the recommendations tabulated above. The NYSDEC Waterbody Inventory and Priority Waterbodies List (WI/PWL) was used to identify stresses and associated sources for each HUC10. Recommendation priorities were then determined for each HUC10 based on the current watershed issues, existing partnerships, and vulnerabilities.

Table 1 summarizes the stressors and sources for each HUC10 watershed. Table 2 identifies priority recommendation focus areas for each of these areas. These tables are incorporated to provide suggested focus areas for each HUC10 to prioritize implementation of the general recommendations.

High priority consists of subwatersheds with scores 56-85, medium priority subwatersheds represent those scoring 36-55 and lower priority represents scores below 35.
4.1 Summary of Subwatershed Stressors and Sources

</table>
4.3 Upper St. Lawrence (04150301)

The Upper St. Lawrence River watershed is located at the most northern portion of the basin along the St. Lawrence River. Municipalities wholly or partially within this subwatershed include: City of Ogdensburg, Villages of Cape Vincent, Clayton, Alexandria Bay, Morristown, Waddington, and Towns of Cape Vincent, Orleans, Alexandria, Hammond, Morristown, Clayton, Lisbon, and Waddington. The subwatershed consists largely of agricultural lands, forests, wetlands, and developed areas. The area is home to the largest cattle population present within the St. Lawrence River watershed, estimated at 22,500 head. The St. Lawrence River is an important economic asset for the community, drawing residents and tourists to the area.

High Priority Subwatersheds and Key Issues:

- Chippewa Creek (0415030101)
  - Nutrients and sediment from agricultural runoff and streambank erosion
  - Excessive algal and weed growth
  - Water levels, flooding risk, and stormwater management
  - Pathogens and nutrients from failing septic systems
  - Contaminated migratory fish

- Sucker Brook (0415030102)
  - Nutrients and sediment from agricultural runoff and streambank erosion
  - Water levels, flooding risk, and stormwater management
  - High livestock density
  - Contaminated migratory fish

- Robinson Creek (0415030103)
  - Contaminated sediment (Massena-Akwesasne Area of Concern)
  - Water levels and flooding risk
  - Hydromodification and streambank erosion

Priority Recommendations: see Table 2, Table 3, and Appendix Table X for more detailed recommendations for each HUC10.

- Implement agricultural BMPs to enhance nutrient and sediment retention on agricultural lands and prepare for a changing climate and extreme weather events
- Install manure storage facilities to prevent winter spreading and allow for optimal timing of manure application
- Increase engagement with AEM and work with SWCDs to implement Tier III management plans
- Survey streambanks and restore unstable streambanks to preserve natural hydrology and reduce erosion
- Limit or restrict development in flood-prone areas and adopt shoreline setback regulations
- Review and update floodplain and/or flood damage protection regulations to increase resiliency to rising water levels, storm surge, and flooding
- Perform a detailed assessment of flood-prone tributaries, including critical culverts and bridges
- Participate in the National Flood Insurance Program’s (NFIP) Community Rating System to enforce floodplain management activities
- Map areas at risk of flooding using topographic survey, hydrological assessments, and GIS mapping in collaboration with FEMA
- Protect floodplains and wetlands
- Address combined sewer overflows (CSOs)
  - City of Ogdensburg maintains 7 CSOs and the Village of Clayton maintains 2 CSOs. Ogdensburg. The City of Ogdensburg has recently experienced several overflow events. Efforts should be made to separate stormwater and sewer lines, implement green infrastructure to reduce runoff into the combined system, or construct/expand storage capacity.
- Address failing septic systems
- Prepare public water and wastewater infrastructure to meet needs for a changing climate and extreme weather events
- Consider expanding connections to public wastewater infrastructure
- Incorporate effective stormwater management practices and programs
- Prepare and adopt stormwater drainage plans and incorporate green infrastructure
- Continue remediation activities and plans in the Massena-Akwesasne Area of Concern

### 4.4 Oswegatchie River (04150302)

The Oswegatchie River originates in the Adirondack Mountains and flows north to the St. Lawrence River. Municipalities wholly or partially within the subwatershed include: City of Ogdensburg, Villages of Antwerp, Harrisville, Gouverneur, Richville, Rensselaer Falls, Huevelton, and Towns of Fine, Clifton, Pitcairn, Edwards, Fowler, Gouverneur, Dekalb, and Oswegatchie. The headwaters are located in protected forested lands within the Adirondack Park with few cited impairments, therefore recommendations will be focused on protection. Downstream segments are used primarily for agriculture with multiple dairy farms and a substantial amount of row-crop production (mainly corn grown for silage). The lowlands scored higher in the subwatershed assessment, meaning that efforts should be focused on restoration of the watershed. Significant lakes within this HUC10 include Cranberry Lake, Crooked Lake, Star Lake, and Moon Lake. The Oswegatchie River is known for excellent fishing.

*High Priority Subwatersheds and Key Issues:*
Boland Creek (0415030208)
- Nutrients and sediment from agricultural runoff and streambank erosion
- Excessive algal weed/growth of lakes impairs recreation and aquatic habitat
- Invasive species management of recreational, high-use lakes (Eurasian watermilfoil in Moon Lake)
- Nutrients and pathogens from failing septic systems
- Flooding risk
- Waters are largely unassessed within NYSDEC WI/PWL

Beaver Creek (0415030209)
- Nutrients and sediment from agricultural runoff and streambank erosion
- Stormwater management
- Flooding risk
- Waters are largely unassessed within NYSDEC WI/PWL

Lisbon Creek (0415030210)
- Nutrients and sediment from agricultural runoff and streambank erosion
- Stormwater management
- Flooding risk

Medium Priority Subwatersheds and Key Issues:

- Headwaters Oswegatchie River (0415030201)
  - Acidified waters
  - Road salt pollution

- Little River (0415030202)
  - Contaminated sediment from improper industrial disposal
  - Acidified waters
  - Failing/inadequate septic systems
  - Road salt pollution
  - Waters are largely unassessed within NYSDEC WI/PWL

- Stammer Creek (0415030206)
  - Pathogens and nutrients from failing septic systems
  - Nutrients from agricultural runoff create eutrophic conditions in streams
  - Waters are largely unassessed within NYSDEC WI/PWL

- Matoon Creek (0415030207)
  - Nutrients and sediment from agricultural runoff, streambank erosion, and improper manure management

Lower Priority Subwatersheds and Key Issues:
Priority Recommendations: see Table 2, Table 3, and Appendix Table X for more detailed recommendations for each HUC10.

- Implement agricultural BMPs to enhance nutrient and sediment retention on agricultural lands and prepare for a changing climate and extreme weather events
- Install manure storage facilities to reduce the need for winter spreading and allow for optimal timing of manure application
- Increase engagement with AEM and work with SWCDs to implement Tier III management plans
- Address agriculture on steep slopes
- Survey streambanks and restore unstable streambanks to preserve natural hydrology and reduce erosion
- Protect floodplains and wetlands
- Incorporate green infrastructure and stormwater management techniques
- Implement road salt BMPs to reduce road salt transport and pollution
- Address failing or inadequate septic systems with a priority on septic systems along shorelines
- Address CSOs by separation, green infrastructure, or enhanced storage
- Invest in upgrades to public water and wastewater infrastructure to prepare for a changing climate and extreme weather events
- Review and update floodplain and/or flood damage protection regulations to increase resiliency to rising water levels, storm surges, and flooding

4.5 **Indian River (04150303)**

The Indian River watershed supports a mixture of land uses, with dense forest lands at the headwaters, urban areas surrounding the US military base Fort Drum, and agricultural lands within the lowlands. Municipalities wholly or partially within this subwatershed include: Villages of Philadelphia, Evans Mills, Theresa, and Hammond, and Towns of Theresa, Antwerp, Philadelphia, Le Ray, Wilna, Croghan, Diana, Rossie, Macomb, and DePeyster. The subwatershed has 18 lakes; largest
are Lake Bonaparte, Narrow Lake, Indian Lake, Red Lake, Millsite Lake, Muskellunge Lake, Butterfield Lake, and Black Lake. The watershed has no land within the Adirondack State Park.

**High Priority Subwatersheds and Key Issues:**

- **Otter Creek (0415030303)**
  - Nutrients and sediment from agricultural runoff, streambank erosion, and improper manure management
  - Construction and development
  - Stormwater runoff and hydromodification

- **Black Lake (0415030305)**
  - Excessive algal/plant growth impairs recreational use of lakes (Black Lake, Grass Lake, Millsite Lake, Butterfield Lake)
  - Invasive species management (Eurasian watermilfoil, curly leafed pondweed, European frogbit, common carp, zebra mussels)
  - Eutrophic conditions and frequent algal blooms
  - High public access increases vulnerability to invasives
  - Nutrient and sediment pollution from agricultural runoff, streambank erosion, and septic systems
  - Waters are largely unassessed within NYSDEC WI/PWL
  - Stressed aquatic habitat

**Medium Priority Subwatersheds and Key Issues:**

- **Headwaters Indian River (0415030301)**
  - Invasive species management (Eurasian watermilfoil)
  - Excessive algal/plant growth impacts recreational use of lakes

- **Black Creek (0415030302)**
  - Nutrients and sediment from agricultural runoff and streambank erosion
  - Stormwater runoff and hydromodification
  - Waters are largely unassessed within NYSDEC WI/PWL

- **Red Lake (0415030304)**
  - Nutrients and sediment from agricultural runoff
  - Flooding risk

**Priority Recommendations:** see [Table 2](#), [Table 3](#), and [Appendix Table X](#) for more detailed recommendations for each HUC10.

- Incorporate effective stormwater management practices into new construction
- Implement agricultural BMPs to enhance nutrient and sediment retention on agricultural lands and prepare for a changing climate and extreme weather events
- Increase engagement with AEM and work with SWCDs to implement Tier III management plans
- Address failing or inadequate septic systems with a priority on septic systems along shorelines by implementing inspection programs and developing educational materials on proper maintenance
- Install boat wash stations and staff with watershed stewards on high-use days to educate the public on invasive species
- Implement aquatic vegetation management (Butterfield Lake, Millsite Lake)
- Encourage all lakes to participate in the Citizens Statewide Lake Assessment Program (CSLAP) to document trends in water quality
- Establish a HABs monitoring network and train the public, especially lakefront homeowners, on HABs identification and reporting to the state NYHABs program.
- Review and update floodplain and/or flood damage protection regulations to increase resiliency to flooding and extreme weather events
- Prepare and adopt stormwater drainage plans and incorporate green infrastructure
- Survey streambanks and restore unstable streambanks to preserve natural hydrology and reduce erosion
- Harden public water and wastewater infrastructure to prepare for a changing climate and extreme weather events
- Incorporate green infrastructure and stormwater management techniques

4.6 Grasse River (04150304)

The Grasse River consists of two main branches of streams and ponds known as the Upper Branch and the Lower Branch that meet in the Town of Russell and head north to drain into the St. Lawrence River near Massena. Municipalities that are wholly or partially within this watershed are the Villages of Canton, and Massena and the Towns of Colton, Hermon, Canton, Russell, Clare, Pierrepont, Madrid, and Louisville. The watershed drains urban (3% including Massena and Canton), forested, and agricultural land. About 40% of the watershed is within the Adirondack State Park. Major resource concerns are related to forestry and recreational development in the watershed.

**High Priority Subwatersheds and Key Issues:**

- Lower Grasse River (0415030405)
  - Nutrient and sediment pollution from agricultural runoff and streambank erosion
  - Contaminated sediment from improper industrial pollution at the Massena-Akwesasne Area of Concern
» Flooding risk
» Stormwater management

Medium Priority Subwatersheds and Key Issues:

- Upper Grasse River (0415030402)
  » Waters are largely unassessed within NYSDEC WI/PWL
- Little River (0415030403)
  » Nutrient and sediment pollution from agricultural runoff
  » Hydromodification and streambank erosion
  » Stormwater management
- Middle Grasse River (0415030404)
  » Nutrient and sediment pollution from agricultural runoff
  » Hydromodification and streambank erosion
  » Stormwater management

Lower Priority Subwatersheds and Key Issues:

- Headwaters Grasse River (0415030401)
  » Acidified waters
  » Road salt pollution

Priority Recommendations: see Table 2, Table 3, and Appendix Table X for more detailed recommendations for each HUC10.

- Implement agricultural BMPs to enhance nutrient and sediment retention on agricultural lands and prepare for a changing climate and extreme weather events
- Increase engagement with AEM and work with SWCDs to implement Tier III management plans
- Survey streambanks and restore unstable streambanks to preserve natural hydrology and reduce erosion
- Review and update floodplain and/or flood damage protection regulations to increase resiliency to flooding and extreme weather events
- Protect shorelines and wetlands and preserve open-space by incorporating public parks and trails that limit development
- Prepare and adopt stormwater drainage plans and incorporate green infrastructure
- Prepare public water and wastewater infrastructure to prepare for a changing climate and extreme weather events
- Consider extending sewer districts to serve additional properties in critical areas
- Address combined sewer overflows (CSOs) by separation, green infrastructure, and expanded storage.
- Map areas at risk of flooding using topographic survey, hydrological assessments, and GIS mapping in collaboration with FEMA
- Implement road salt BMPs to reduce road salt transport and pollution
- Continue remediation activities and plans in the Massena-Akwesasne Area of Concern
- Collaborate with NYSDEC to update WI/PWL and assess waters

4.7 Raquette River (04150305)

The Raquette River watershed is the largest, most extensively forested, and least agriculturally intensive watershed in the St. Lawrence River basin. Much of the land (75%) resides within the Adirondack State Park offering it some protections. Municipalities that are wholly or partially within the watershed include the Villages of Speculator, Tupper Lake, Norwood, and Potsdam and the Towns of Webb, Lake Pleasant, Long Lake, Arietta, Inlet, Indian Lake, Newcomb, North Elba, Harrietstown, Tupper Lake, Piercefield, Parishville, Potsdam, Norfolk, and Massena.

Medium Priority Subwatersheds and Key Issues:

- Raquette Lake (0415030501)
  - Acidified lakes
  - Invasive species
  - High recreational use
  - Nutrients and pathogens from failing/inadequate septic systems
  - Road salt pollution
- Big Brook (0415030503)
  - Acidified waters
  - Nutrients and pathogens from failing/inadequate septic systems
  - Stormwater management
  - Road salt pollution
- Tupper Lake (0415030504)
  - Acidified waters
  - Invasive species
  - High recreational use
  - Waters are largely unassessed within NYSDEC WI/PWL
- Jordan River (0415030505)
  - Acidified waters
  - Waters are largely unassessed within NYSDEC WI/PWL
  - Flooding risk
- Parkhurst Brook (0415030506)
  - Acidified waters
  - Nutrients and sediment from agricultural runoff and streambank erosion
  - Flooding risk
  - Waters are largely unassessed within NYSDEC WI/PWL
- Raquette River (0415030507)
  - Nutrients and sediment from agricultural runoff and streambank erosion
  - Pathogens and nutrients from failing/inadequate septic systems
  - Flooding risk
  - Contaminated sediment in the Massena-Akwesasne Area of Concern

Lower Priority Subwatersheds and Key Issues:

- Cold River (0415030502)
  - Acidified waters

Priority Recommendations: see Table 2, Table 3, and Appendix Table X for more detailed recommendations for each HUC10.

- Protect floodplains and wetlands
- Incorporate smart growth policies that guide development and prevent erosion and nonpoint source pollution
- Address failing or inadequate septic systems with a priority on septic systems along shorelines by implementing inspection programs and developing educational materials on proper maintenance (Long Lake)
- Implement road salt BMPs to reduce off-road transport and pollution of surface and ground waters
- Survey streambanks and restore unstable streambanks to preserve natural hydrology and reduce erosion
- Educate landowners on best forestry management practices
- Install boat wash stations with watershed stewards on high-use lake days to educate the public on invasive species
- Implement aquatic vegetation management at Long Lake
- Encourage all lakes to participate in the Citizens Statewide Lake Assessment Program (CSLAP) to monitor water quality and document trends
- Establish a HABs monitoring network and train the public, especially lakefront homeowners, on HABs identification (Long Lake) in collaboration with the NYHABs reporting program
- Investigate the feasibility of extending public sewers into regions with small lots and inadequate soils for waste disposal (Raquette River)
- Collaborate with NYSDEC to update WI/PWL and assess waters
- Invest in public water and wastewater infrastructure to prepare for a changing climate and extreme weather events
- Prepare and adopt stormwater drainage plans and incorporate green infrastructure
- Consider clustering/expanding connections in sewer areas
- Protect shorelines and wetlands and preserve open-space by incorporating public parks and trails that limit development
- Review and update floodplain and/or flood damage protection regulations to increase resiliency to flooding and extreme weather events

4.8 St Regis River (04150306)
The St. Regis River watershed drains over 800 miles of extensively forested lands. About 60% of the watershed is within the Adirondack Park. Agriculture tends to be clustered in the northern half of the watershed along the St. Lawrence plains. Municipalities wholly or partially within the watershed include: Towns of Santa Clara, Hopkinton, Waverly, Brighton, Duane, Brandon, Dickinson, Lawrence, Moira, Brasher, and Stockholm.

Medium Priority Subwatersheds and Key Issues:

- West Branch (0415030602)
  » Nutrients and sediment from streambank erosion
  » Acidified waters
  » Waters are largely unassessed within NYSDEC WI/PWL
- Deer River (0415030603)
  » Nutrients from agricultural runoff and streambank erosion
  » Invasive species management (Eurasian watermilfoil)
  » Excessive plant and algal growth impact recreational use and habitat
  » Occasional shoreline algal blooms
  » Acidified waters
- St Regis River (0415030604)
  » Acidified waters
  » Nutrients and sediment from agricultural runoff and streambank erosion
  » Contaminated sediment from improper industrial disposal
  » Nutrients and pathogens from failing/inadequate septic systems
  » Algal blooms and harmful algal blooms
  » Excessive plant and algal growth impact recreational use and habitat

Lower Priority Subwatersheds and Key Issues:
Priority Recommendations: see Table 2, Table 3, and Appendix Table X for more detailed recommendations for each HUC10.

- Implement agricultural BMPs to enhance nutrient and sediment retention on agricultural lands and prepare for a changing climate and extreme weather events
- Increase engagement with AEM and work with SWCDs to implement Tier III management plans
- Educate landowners on best forestry management practices
- Survey streambanks/shorelines and restore those in need to preserve natural hydrology and reduce erosion
- Implement road salt BMPs to reduce the risk of pollution of surface water and groundwater
- Encourage participation in the Citizens Statewide Lake Assessment Program (CSLAP) to monitor water quality and document trends
- Address failing or inadequate septic systems with a priority on septic systems along shorelines
- Harden public water and wastewater infrastructure to prepare for a changing climate and extreme weather events
- Install boat wash stations and staff with watershed stewards on high-use days to educate the public on invasive species
- Encourage all lakes to participate in CSLAP to document trends in water quality
- Establish a HABs monitoring network and train the public, especially lakefront homeowners, on HABs identification and reporting to the NYHABs program
- Continue remediation activities and plans in the Massena-Akwesasne Area of Concern
- Collaborate with NYSDEC to update WI/PWL and assess waters

4.9 Salmon River (04150307)

The Salmon River watershed drains approximately 400 miles of forested and agricultural lands from the Adirondack foothills to the international border. The watershed supports a world-class fishery of wild brook and brown trout populations. Municipalities wholly or partially within the watershed include: Villages of Brushton and Malone, and the Towns of Franklin, Malone, Bangor, Bombay, Fort Covington, and Westville.

High Priority Subwatersheds and Key Issues:

- Salmon River (0415030703)
» Nutrients and sediment from agricultural runoff, manure spreading, and streambank erosion
» Sedimentation and altered habitats due to hydromodification and potential releases from dams
» Erosion from new construction in the area
» Excessive plant and algal growth
» Decreasing riparian vegetation
» Nutrients from failing/inadequate septic systems

Medium Priority Subwatersheds and Key Issues:

- Headwaters Salmon River (0415030701)
  » Sedimentation and altered habitats due to hydromodification and potential releases from dams
  » Streambank erosion
  » Nutrient pollution from failing/inadequate septic systems
  » Acidified waters
  » Invasive species management
  » Excessive plant and algal growth in Mountain View and Indian Lakes

- Little Salmon River (0415030702)
  » Waters are largely unassessed within NYSDEC WI/PWL

Priority Recommendations: see Table 2, Table 3, and Appendix Table X for more detailed recommendations for each HUC10.

- Implement agricultural BMPs to enhance nutrient and sediment retention on agricultural lands and prepare for a changing climate and extreme weather events
- Install manure storage facilities to prevent winter spreading and allow for optimal timing of manure application
- Increase engagement with AEM and work with SWCDs to implement Tier III management plans
- Survey streambanks/shorelines and restore those in need to preserve natural hydrology and reduce erosion
- Assess and identify dams in need of restoration or dredging to prevent sediment release
- Encourage all lakes to participate in CSLAP to monitor water quality and document trends
- Incorporate smart growth and land use policies to guide development and minimize erosion and nonpoint source pollution
- Address failing or inadequate septic systems with a priority on septic systems along shorelines
- Work with landowners to increase riparian buffer areas along streambanks
- Protect shorelines and wetlands and preserve open-space by incorporating public parks and trails that limit development

4.10 Chateaugay-English (04150308)

The Chateaugay-English watershed is located in the northeastern corner of the basin, spanning across Clinton and Franklin counties. This subwatershed includes comparatively small areas of lakes and streams. The southern half of the watershed within the Adirondack Park remains mostly forested, while the northern half supports agricultural uses along the river plain. Municipalities that are wholly or partially within the watershed include the Villages of Chateaugay and Burke, and the Towns of Bellmont, Dannemora, Ellenburg, Constable, Burke, Chateaugay, Clinton, and Mooers.

Medium Priority Subwatersheds and Key Issues:

- Headwaters Chateaugay River (0415030801)
  - Excessive plant growth impacts recreational uses of Chateaugay Lake
  - Invasive species management (Eurasian watermilfoil)
  - Waters are largely unassessed within NYSDEC WI/PWL
- Upper Chateaugay River (0415030802)
  - Waters are largely unassessed within NYSDEC WI/PWL
  - Nutrients and sediment from agricultural runoff
- Trout River (0415030803)
  - Waters are largely unassessed within NYSDEC WI/PWL
  - Nutrients and sediment from agricultural runoff

Lower Priority Subwatersheds and Key Issues:

- English River (0415030804)
  - Waters are largely unassessed within NYSDEC WI/PWL

Priority Recommendations: see Table 2, Table 3, and Appendix Table X for more detailed recommendations for each HUC10.

- Implement agricultural BMPs to enhance nutrient and sediment retention on agricultural lands and prepare for a changing climate and extreme weather events
- Install manure storage facilities to prevent winter spreading and allow for optimal timing of manure application
- Increase engagement with AEM and work with SWCDs to implement Tier III management plans
- Encourage all lakes to participate in the Citizens Statewide Lake Assessment Program (CSLAP) to document water quality conditions and trends
- Improve public water and wastewater infrastructure to prepare for a changing climate and extreme weather events
- Install boat wash stations staffed with watershed stewards on high-use days to educate the public on invasive species
- Secure funding for invasive species management efforts
- Collaborate with NYSDEC to update WI/PWL and assess waters
5 Implementation Strategy & Schedule

This chapter connects general recommendations to the identified focus areas for each HUC10 subwatershed by providing greater geographic detail on site-specific projects through an implementation strategy and project matrix.

5.1 Implementation Strategies and Projects

The implementation strategy matrix (Appendix X) lists specific strategies and projects needed to protect and restore the watershed. Project level recommendations tend to focus on addressing point and nonpoint sources of pollution in low-scoring subwatersheds to improve degraded water quality, habitat, and recreational opportunities. Recommended actions for mid to high-scoring subwatersheds center around protection of waters and related natural resources. Recommended projects were gathered with input from the Watershed Advisory Committee and watershed stakeholders. The matrix includes priority actions, objective area, action, target subwatersheds, strategies/goals, potential partners, implementation timeline, and approximate costs. Projects by category (i.e., agricultural management, invasive species management, etc.). Cost ranges for recommended actions and practices are presented as follows in tables throughout this chapter:

- $ Up to $25,000
- $$ $25,000 - $50,000
- $$$ $50,000 - $100,000
- $$$$ $100,000 - $500,000
- $$$$$ Greater than $500,000

Recommended projects are specific to each HUC10 and its individual needs. At this time, recommended projects focus on restoration and protection actions to reduce erosion and nonpoint source pollution, restore natural hydrology and build resiliency, and provide structure for future planning. Specifically, the goals include:

- Control agricultural nonpoint sources
- Reduce nonpoint source pollution from residential property and community landscapes
- Address invasive species issues
- Reduce nonpoint source pollution from municipal activities
- Integrate monitoring programs, consolidate data, and report progress
- Develop and coordinate funding and other resources to advance implementation efforts
- Adopt or amend local regulations designed to reduce nonpoint source pollution
- Provide for ongoing collaboration, implementation, and planning
- Develop an appreciation for watershed services through educational campaigns
- Increase resiliency to flooding, climate change, and emerging threats
Support community and habitat revitalization

Although each of the recommendations would improve conditions, implementation involves significant resources in terms of time, funding, staff, and support. Therefore, Table 2 and Table 3 identify the most significant issues in each HUC10 and give priority to implementation strategies and projects that address those focus areas.

Recommendations for advancing collaborations, partnerships, and outreach are designed to enhance connections that will maximize capacity and resources needed for implementation. Consequently, advancing those collaborations and partnerships should be considered as priorities. Advancing municipal and programmatic actions that promote sustainability, reduce risk of flood damage, and revitalize communities should also be adopted as soon as possible by municipalities, with a priority focus on shoreline communities that are frequently impacted by flooding.

5.2 Potential Funding Sources

Many potential funding sources exist to aid in implementation of the St. Lawrence River Watershed Revitalization Plan; most are federal, state, and local (program-specific). An overview of selected funding sources and eligible activities is presented in Table 4. Additional information on agricultural conservation funding programs can be found in the Black River Watershed Management Plan, Part II: Appendices, Section 8.7.1 (Bergmann Associates, 2010).

**LOCAL**

| Municipalities | Municipal budgets | Provide labor and equipment from Departments of Highways and/or Public Works to do tasks such as clean debris from streams, culverts, storm drains, etc. | All                                                                                     |

Note: See USEPA’s Water Finance Clearinghouse for more information.

5.3 Implementation Framework

Implementation of the Plan will be an ongoing process that will continue for many years in the future. The St. Lawrence River Watershed Revitalization Plan will be a “living document” that is adaptive to the needs and conditions of the watershed. The projects and actions described above represent the first round of implementation for restoration and protection. Other projects will be added in the future as the Plan is implemented, conditions change, and priorities shift. Periodic assessments will be essential to reflect changes in water quality, new opportunities, and issues within the watershed. Future actions should be prioritized and implemented in a way that carries out the vision for the future and supports the goals of the watershed.

5.3.1 Implementation Team

To manage ongoing implementation, the St. Lawrence River Watershed Project will establish a Steering Team comprised of representatives of the watershed’s Soil & Water Conservation Districts, regional and county planning departments, NYSDOS, NYSDEC, and state and local stakeholders as appropriate. The Steering Committee will meet on a quarterly basis to review progress and determine future watershed projects and funding opportunities. Status reports will be made available on the St. Lawrence River Watershed Project’s website.

To implement the identified recommendations in **Sections 3** and **4**, the following issues should be addressed immediately:

- Identify existing gaps in skills and resources (e.g., technical assistance, staffing capacity) and develop a strategy to meet those needs.
5.4 Mechanisms for Tracking Implementation and Monitoring Progress

Tracking progress of the Plan is essential to the watershed planning process and evaluating effectiveness. Implementation strategy activities will be monitored and tracked through an Implementation Strategy Tracking Template that includes details such as action, HUC10, goal, responsible party, funding sources, estimated cost, and project status/progress. Steering Committee members will be able to edit or add projects and provide updates on project completion. Eventually, an effort should be made to incorporate management efforts into a GIS map-based tracking system that can be used in conjunction with the subwatershed assessment scores or environmental data. This system would provide documentation of the progress of watershed management activities and allow stakeholders to visualize and evaluate the implementation strategy.

5.5 Monitoring Long-Term Watershed Health

The watershed planning process requires continual feedback on watershed conditions in order to evaluate the response of the watershed to management efforts. The subwatershed assessment used to set priority subwatersheds should be repeated as new data become available and water quality and community needs change.
